Mesh & Net

Insect netting field checklist

Check these points alongside your dimensions. The fabric is one part of the growing system.

Crop / site

Reference / project

Date / notes

- [ ] **Before covering**
  Check whether the target pest is already present in the crop or soil. Exclusion netting can also keep pests inside. Plan placement around the crop cycle.

- [ ] **Harvest access and pollination**
  Plan openings for weeding and harvest, and a pollination strategy suited to the crop. Close access points and check gaps when exclusion is required.

- [ ] **Heat and ventilation**
  Finer openings can restrict air movement. Monitor crop conditions under the cover; do not treat pest exclusion as a guarantee against heat or humidity problems.

- [ ] **Handling and storage**
  Avoid dragging the net across rough edges. Inspect holes and seams, follow the manufacturer's cleaning guidance, and store clean and dry before reuse.

Preparation checklist, not an installation design. Confirm the product specification, supports and fixing requirements for your project.
